

# Micro Credit Defaulter Project Report

Submitted by: HANUMESH K

# **ACKNOWLEDGMENT**

I would like to express my deepest gratitude to my SME (Subject Matter Expert) Khushboo Garg as well as Flip Robo Technologies who gave me the opportunity to do this project on Micro Credit Defaulter Project, which also helped me in doing lots of research wherein I came to know about so many new things.

Also, I have utilized a few external resources that helped me to complete the project. I ensured that I learn from the samples and modify things according to my project requirement. All the external resources that were used in creating this project are listed below:

- 1) https://www.google.com/
- 2) https://www.youtube.com/

# **INTRODUCTION**

#### Business Problem Framing

A Microfinance Institution (MFI) is an organization that offers financial services to low-income populations. MFS becomes very useful when targeting especially the unbanked poor families living in remote areas with not much sources of income. The Microfinance services (MFS) provided by MFI are Group Loans, Agricultural Loans, Individual Business Loans and so on. Many microfinance institutions (MFI), experts and donors are supporting the idea of using mobile financial services (MFS) which they feel are more convenient and efficient, and cost saving, than the traditional high-touch model used since long for the purpose of delivering microfinance services. Though, the MFI industry is primarily focusing on low-income families and are very useful in such areas, the implementation of MFS has been uneven with both significant challenges and successes.

# Conceptual Background of the Domain Problem

Today, microfinance is widely accepted as a poverty-reduction tool, representing \$70 billion in outstanding loans and a global outreach of 200 million clients. We are working with one such client that is in Telecom Industry. They are a fixed wireless telecommunications network provider. They have launched various products and have developed its business and organization based on the budget operator model, offering better products at Lower Prices to all value conscious customers through a strategy of disruptive innovation that focuses on the subscriber. They understand the importance of communication and how it affects a person's life, thus, focusing on providing their services and products to low-income families and poor customers that can help them in the need of hour. They are

collaborating with an MFI to provide micro-credit on mobile balances to be paid back in 5 days. The Consumer is believed to be defaulter if he deviates from the path of paying back the loaned amount within the time duration of 5 days. For the loan amount of 5 (in Indonesian Rupiah), payback amount should be 6 (in Indonesian Rupiah), while, for the loan amount of 10 (in Indonesian Rupiah), the payback amount should be 12 (in Indonesian Rupiah).

#### Review of Literature

#### 1. What is Microfinance?

"Microfinance" is often seen as financial services for poor and low-income clients. In practice, the term is often used more narrowly to refer to loans and other services from providers that identify themselves as "microfinance institutions" (MFIs).

Microfinance can also be described as a setup of a number of different operators focusing on the financially under-served people with the aim of satisfying their need for poverty alleviation, social promotion, emancipation, and inclusion.

Microfinance

institutions reach and serve their target market in very innovative ways.

Microfinance operations differ in principle, from the standard disciplines of general and entrepreneurial finance. This difference can be attributed to the fact that the size of the loans granted with microcredit is typically too small to finance growth-oriented business projects. Some unique features of microfinance as follows:

- i. Delivery of very small loans to unsalaried workers.
- ii. Little or no collateral requirements.
- iii. Group lending and liability.
- iv. Pre-loan savings requirement.
- v. Gradually increasing loan sizes.

Implicit guarantee of ready access to future loans if present

loans are repaid fully and promptly Microfinance is seen as a catalyst for

poverty alleviation, delivered in innovative and sustainable ways to assist the underserved poor, especially in developing countries.

#### 2. Default in Microfinance

Default in microfinance is the failure of a client to repay a loan. The default could be in terms of the amount to be paid or the timing of the payment.

#### Motivation for the Problem Undertaken

Our main objective of doing this project is to build a model to predict whether the users are paying the loan within the due date or not. We are going to predict by using Machine Learning algorithms.

The sample data is provided to us from our client database. In order to improve the selection of customers for the credit, the client wants some predictions that could help them in further investment and improvement in selection of customers.

# **ANALYTICAL PROBLEM FRAMING**

#### Mathematical/ Analytical Modeling of the Problem

There are various analytics which I have done before moving forward with exploratory analysis, on the basis of accounts which got recharged in the last 30 days. I set the parameter that if the person is not recharging their main account within 3 months, I simply dropped their data because they are not valuable and they might be old customers, but there is no revenue rotating. Then I had checked the date columns and found that the data belongs to the year 2016. I extracted the month and day from the date, saved the data in separate columns, and tried to visualize the data on the basis of months and days.

I had checked the maximum amount of loan taken by the people and found that the data had more outliers. As per the description given by the client, the loan amount can be paid by the customer is either rupiah 6 or 12 so that I have dropped all the loan amount that shows the loan is taken more than 12 rupiah.

Then I separated the defaulter's data and checked the valuable customers in the network and we found that their monthly revenue is more than 10000 rupiah. Although the data is quite imbalanced and many columns doesn't have that expected maximum value, we dropped that columns. We checked the skewed data and try to treat the skewed data before model processing which caused NaN so avoided it.

When we try removing the unwanted data, i.e., the outliers, we found that almost 40000+ data has been chopped. Though the data given by the client had almost 37 columns and over 2 lakh columns I did not feel like losing on precious data so avoided the outlier removal part as well. After scaling my data, I have sent the data to various classification models and found that Extra Trees Classifier Algorithm is working well.

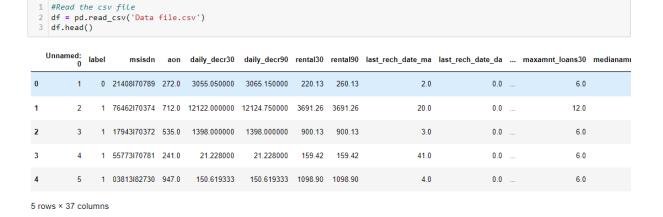

#### Data Sources and their formats

The data has been provided by one of our clients from the telecom industry. They are a fixed wireless telecommunications network provider and they have launched various products and have developed their business and organization based on the budget operator model, offering better products at Lower Prices to all value conscious customers through a strategy of disruptive innovation that focuses on the subscriber.

The data was given by an Indonesian telecom company and they gave it to us in a CSV file, with a data description file in excel format. They also had provided the problem statement by explaining what they need from us and also the required criteria to be satisfied.

Let's check the data now. Below I have attached the snapshot below to give an overview.

```
#import libraries
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
import warnings
warnings.filterwarnings("ignore")
```

Here we are taking a look at the first 5 and last 5 rows of our dataset. It shows that we have a total of 209593 rows and 37

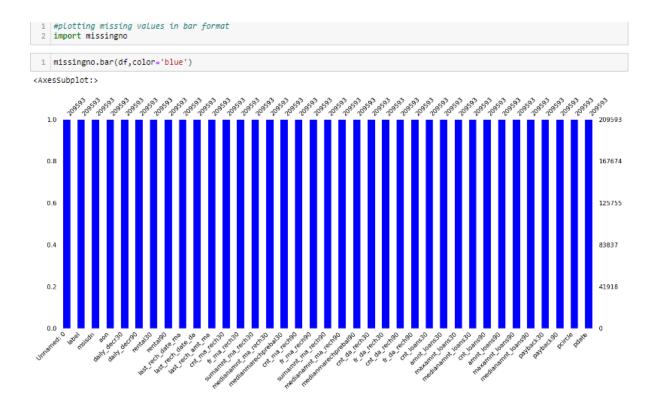

columns present in our dataframe. We have the label column that stores the defaulter and non-defaulter values marked with 0 and 1 making this a Classification problem!

### Data Preprocessing Done

Checked for missing values to confirm the information of no null values present provided in the problem statement.

```

```

Took a visual on the missing data information as well.

Using the info method, we are able to confirm the non-null count details as well as the datatype information. We have 21 float/decimal datatype, 12 integer data type and 3 object/categorical data type columns. We will need to convert the object data type columns to numerical data before we input the information in our machine learning models.

# State the set of assumptions (if any) related to the problem under consideration

I had made an assumption that any telecom company keeps the data of customers within 3 months so I have chopped off my data on the basis of that.

I have dropped the 2016 year from date columns because the data is from the year 2016, only the date and months are different. We separated months and days into different columns.

Then I separately checked the defaulter's data and found that many valuable users are defaulters as they might have forgotten to pay or they are having a busy life. I separated them so that the company can deal politely, because we cannot lose these customers.

# MODEL/S DEVELOPMENT AND EVALUATION

 Identification of possible problem-solving approaches (methods)

We have used the describe method to check the numerical data details. There are 33 columns which have numerical values in them and it looks like the count, mean, standard deviation, minimum value, 25% quartile, 50% quartile, 75% quartile and maximum value are all mostly properly distributed in terms of data points but I do see some abnormality that we will confirm with a visual on it.

# Key Metrics for success in solving problem under consideration

The key metrics used here were accuracy\_score, cross\_val\_score, classification report, auc\_score and confusion matrix. We tried to find out the best parameters and also to increase our scores by using Hyperparameter Tuning and we will be using GridSearchCV method.

#### 1. Cross Validation:

Cross-validation helps to find out the overfitting and underfitting of the model. In the cross validation the model is made to run on different subsets of the dataset which will get multiple measures of the model. If we take 5 folds, the data will be divided into 5 pieces where each part being 20% of the full dataset. While running the Cross-validation the 1st part (20%) of the 5 parts will be kept out as a holdout set for validation and everything else is used for training data. This way we will get the first estimate of the model quality of the dataset. In the similar way further iterations are made for the second 20% of the dataset is held as a holdout set and remaining 4 parts are used for training data during the process. This way we will get the second estimate of the model quality of the dataset. These steps are repeated during the cross-validation process to get the remaining estimate of the model quality.

2. Confusion Matrix: A confusion matrix, also known as an error matrix, is a specific table layout that allows visualization of the performance of an algorithm, typically a supervised learning one (in unsupervised learning it is usually called a matching matrix). Each row of the matrix represents the instances in a predicted class, while each column represents the instances in an actual class (or vice versa). The name stems from the fact that it makes it easy to see whether the system is confusing two classes (i.e., commonly mislabelling one as another).

It is a special kind of contingency table, with two dimensions ("actual" and "predicted"), and identical sets of "classes" in both dimensions (each combination of dimension and class is a variable in the contingency table).

#### Confusion Matrix

```
models = {
 1
       "Logistic Regression"
 2
                                : LogisticRegression(),
 3
       "K Nearest Neighbor"
                                : KNeighborsClassifier(),
       "Decision Tree"
 4
                               : DecisionTreeClassifier(),
 5
       "Random Forest"
                                : RandomForestClassifier(),
       "Gradient Boost"
                               : GradientBoostingClassifier(),
 6
       "XGBoost"
7
                                : xg.XGBClassifier()
8
9
10
   for i in range(len(list(models))):
       model = list(models.values())[i]
11
12
       #Train model
13
       model.fit(X train,y train)
14
15
       print(list(models.keys())[i])
16
17
       print('-'*18)
18
19
       #Confusion Matrix
       plot_confusion_matrix(model,X_test,y_test,cmap='mako')
20
21
       plt.show()
```

3. Classification Report: The classification report visualizer displays the precision, recall, F1, and support scores for the model. There are four ways to check if the predictions are right or wrong: 1. TN / True Negative: the case was negative and predicted negative 2. TP / True Positive: the case was positive and predicted positive 3. FN / False Negative: the case was positive but predicted negative 4. FP / False Positive: the case was negative but predicted positive Precision: Precision is the ability of a classifier not to label an instance positive that is actually negative. For each class, it is defined as the ratio of true positives to the sum of a true positive and false positive. It is the accuracy of positive predictions. The formula of precision is given below: Precision = TP/ (TP + FP)

Recall: Recall is the ability of a classifier to find all positive instances. For each class it is defined as the ratio of true positives to the sum of true positives and false negatives. It is also the fraction of positives that were correctly identified. The formula of recall is given below: Recall = TP/(TP+FN)

F1 score: The F1 score is a weighted harmonic mean of precision and recall such that the best score is 1.0 and the worst is 0.0. F1 scores are lower than accuracy measures as they embed precision and recall into their computation. As a rule of thumb, the weighted average of F1 should be used to compare classifier models, not global accuracy. The formula is: F1 Score = 2\*(Recall \* Precision) / (Recall + Precision) Support: Support is the number of actual occurrences of the class in the specified dataset. Imbalanced support in the training data may indicate structural weaknesses in the reported scores of the classifier and could indicate the need for stratified sampling or rebalancing. Support doesn't change between models but

instead diagnoses the evaluation process.

#### 4. AUC-ROC Curve and score:

Curve (ROC AUC) from prediction scores.

AUC (Area Under the Curve) - ROC (Receiver Operating Characteristics) curve is a performance measurement for the classification problems at various threshold settings. ROC is a probability curve and AUC represent the degree or measure of separability. It tells how much the model is capable of distinguishing between classes. Higher the AUC, the better the model is at predicting 0s as 0s and 1s as 1s. By analogy, the Higher the AUC, the better the model is at distinguishing between patients with the disease and no disease. The ROC curve is plotted with TPR against the FPR where TPR is on the y-axis and FPR is on the x-axis. Score is the area Under the Receiver Operating Characteristic

```
models = {
     "Logistic Regression"
 2
                                       : LogisticRegression(),
       "K Nearest Neighbor" : KNeighborsClassifier(),
"Decision Tree" : DecisionTreeClassifier(),
"Random Forest" : RandomForestClassifier(),
"Gradient Boost" : GradientBoostingClassifie
 3
                                       : GradientBoostingClassifier(),
         "XGBoost"
 7
                                       : xg.XGBClassifier()
 8 }
9
10 for i in range(len(list(models))):
         model = list(models.values())[i]
11
12
13
       #Train model
14
         model.fit(X_train,y_train)
15
         print(list(models.keys())[i])
16
         print('-'*18)
17
18
19
         #Auc-Roc Curve
20
         plot = plot_roc_curve(model,X_test,y_test)
         plot.figure_.suptitle('ROC Curve')
21
22
         plt.show()
```

5. Hyperparameter Tuning: There is a list of different machine learning models. They all are different in some way or the other, but what makes them different is nothing but input parameters for the model. These input parameters are named as Hyperparameters. These hyperparameters will define the architecture of the model, and the best part about these is that you get a choice to select these for your model. You must select from a specific list of hyperparameters for a given model as it varies from model to model.

We are not aware of optimal values for hyperparameters which would generate the best model output. So, what we tell the model is to explore and select the optimal model architecture automatically. This selection procedure for hyperparameter is known as Hyperparameter Tuning. We can do tuning by using GridSearchCV.

GridSearchCV is a function that comes in Scikit-learn (or SK-learn) model selection package. An important point here to note is that we need to have Scikit-learn library installed on the computer. This function helps to loop through predefined hyperparameters and fit

your estimator (model) on your training set. So, in the end, we can select the best parameters from the listed hyperparameters.

```
final_model_ = RandomForestClassifier(max_depth=8,n_estimators=150,criterion='gini')
 2 print(final_model_)
 3 print("-----
 4 final_model_.fit(X_train,y_train)
 5 final_model_pred_ = final_model_.predict(X_test)
 6 print(final_model_pred_)
 7 print("Accuracy Score :",accuracy_score(y_test,final_model_pred_))
 9 print("Classification Report : ",classification_report(y_test,final_model_pred_))
RandomForestClassifier(max_depth=8, n_estimators=150)
[0 0 1 ... 0 0 0]
Accuracy Score : 0.8701767506076251

#### Interpretation of the Results

for feature aon:

Data ranges from -48 to 999860 with Mean value of 8112.34. Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature daily\_descr30:

Data ranges from -93 to 265926 with Mean value of 5381.4. Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature daily\_descr90:

Data ranges from -93 to 320630 with Mean value of 6082.52. Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly, for feature rental30:

Data ranges from -23737.14 to 198926 with Mean value of 2692.58. Data is highly spreaded and needs to be treated accordingly.

Data is positively skewed and needs to be treated accordingly. for feature rental90:

Data ranges from -24720 to 200148 with Mean value of 3483.41. Data is highly spreaded and needs to be treated accordingly.

Data is positively skewed and needs to be treated accordingly. for feature last\_rech\_date\_ma:

Data ranges from -29 to 998650 with Mean value of 3755.85. Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature last\_rech\_date\_da: Data ranges from -29 to 999178 with Mean value of 3712.2. Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature last\_rech\_amt\_ma: Data ranges from 0 to 55000 with Mean value of 2064.45. Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature cnt\_ma\_rech30: Data ranges from 0 to 203 with Mean value of 3.98. Data is not distributed normally or in well curve.

Data is spreaded and needs to be treated accordingly.

Data is positively skewed and needs to be treated accordingly. for feature fr\_ma\_rech30:

Data ranges from 0 to 999606 with Mean value of 3737.36. Data is not distributed normally or in well curve.

Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly.

for feature sumamnt\_ma\_rech30:

Data ranges from 0 to 810096 with Mean value of 7704.5. Data is not distributed normally or in well curve. Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature medianamnt\_ma\_rech30: Data ranges from 0 to 55000 with Mean value of 1812.82. Data is not distributed normally or in well curve.

Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature medianmarechprebal30: Data ranges from -200 to 999479 with Mean value of 3851.93. Data is not distributed normally or in well curve. Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature cnt\_ma\_rech90: Data ranges from 0 to 336 with Mean value of 6.32. Data is not distributed normally or in well curve.

Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature fr\_ma\_rech90:

Data ranges from 0 to 88 with Mean value of 7.72. Data is not distributed normally or in well curve.

Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly.

for feature sumamnt\_ma\_rech90:

Data ranges from 0 to 953036 with Mean value of 12396.22. Data is not distributed normally or in well curve. Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature medianamnt\_ma\_rech90: Data ranges from 0 to 55000 with Mean value of 1864.6. Data is not distributed normally or in well curve.

Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature medianmarechprebal90: Data ranges from -200 to 41456 with Mean value of 92.03. Data is not distributed normally or in well curve. Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature cnt\_da\_rech30: Data ranges from 0 to 99914 with Mean value of 262.58. Data is not distributed normally or in well curve.

Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly. for feature fr\_da\_rech30:

Data ranges from 0 to 999809 with Mean value of 3749.49. Data is not distributed normally or in well curve.

Data is highly spreaded and needs to be treated accordingly. Data is positively skewed and needs to be treated accordingly.

for feature cnt da rech90:

Data ranges from 0 to 38 with Mean value of 0.04. Data is distributed normally but not in well curve.

Data is positively skewed and needs to be treated accordingly. for feature fr\_da\_rech90:

Data ranges from 0 to 64 with Mean value of 0.05. Data is not distributed normally or in well curve.

Data is positively skewed and needs to be treated accordingly. for feature cnt\_loans30:

Data ranges from 0 to 50 with Mean value of 2.76. Data is not distributed normally or in well curve.

Data is positively skewed and needs to be treated accordingly. for feature amnt\_loans30:

Data ranges from 0 to 306 with Mean value of 17.95. Data is not distributed normally or in well curve.

Data is positively skewed and needs to be treated accordingly. for feature maxamnt\_loans30:

Data ranges from 0 to 99864 with Mean value of 274.66. Data is not distributed normally or in well curve.

Data is positively skewed and needs to be treated accordingly. for feature medianamnt\_loans30:

Data ranges from 0 to 3 with Mean value of 0.05.

Data is not distributed normally or in well curve and it is understandable as feature has only limited set

of values.

Data is positively skewed and needs to be treated accordingly.

for feature cnt loans90:

Data ranges from 0 to 4997.52 with Mean value of 18.52. Data is not distributed normally or in well curve.

Data is positively skewed and needs to be treated accordingly. for feature amnt\_loans90:

Data ranges from 0 to 438 with Mean value of 23.65. Data is not distributed normally or in well curve.

Data is positively skewed and needs to be treated accordingly. for feature maxamnt\_loans90:

Data ranges from 0 to 12 with Mean value of 6.7.

Data is not distributed normally or in well curve and it understandable as user has two option for loans i.e., 5 and 10 for with 6 and 12 has to be paid.

Data is positively skewed and needs to be treated accordingly. for feature medianamnt\_loans90:

Data ranges from 0 to 3 with Mean value of 0.05.

Data is not distributed normally or in well curve.

Data is positively skewed and needs to be treated accordingly. for feature payback30:

Data ranges from 0 to 171.5 with Mean value of 3.4. Data is not distributed normally or in well curve.

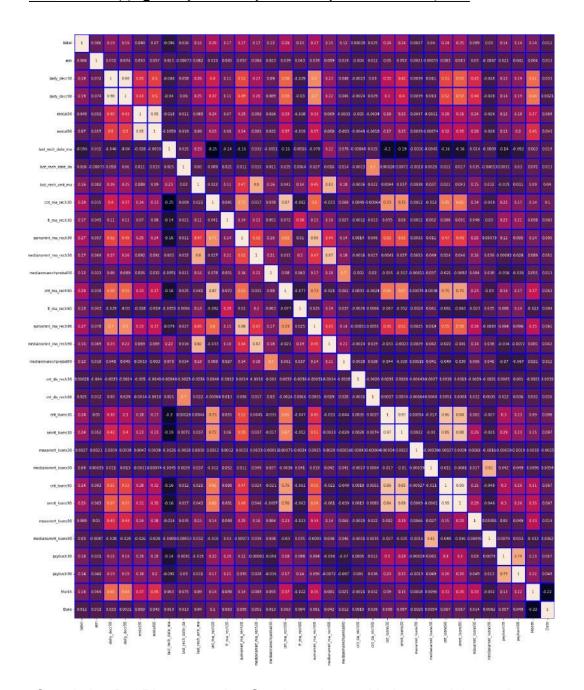

Data is positively skewed and needs to be treated accordingly. for feature payback90:

Data ranges from 0 to 171.5 with Mean value of

4.32. Data is not distributed normally or in well curve.

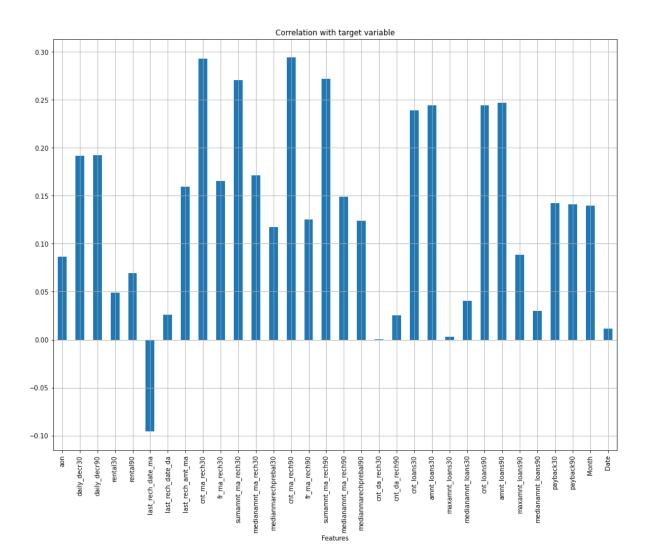

Data is positively skewed and needs to be treated accordingly.

```
#Updated Correlation Matrix
plt.figure(figsize=(30,30))
sns.heatmap(df_corr.T,annot=True,linewidth=3,linecolor='blue')
```

#### Correlation Bar Plot comparing Gender column with the remaining columns

```
df corr = df.corr()
p1t.f1gure(f1gs1ze=(1s,5))
df corr['label'].sort values(ascend1ng=Fa1se).drop('label').p1ot.bar()
plt.title("Correlation of Feature columns vs Label\n", fontsize=16)
p1t. x labe1("\nF eatures L1st", fonts1ze=14)
plt.ylabel("Correlation Value", fontsize=12)
p1t. she()
```

# **CONCLUSION**

Key Findings and Conclusions of the Study

From the final model MFI can find if a person will return money or not and should an MFI provide a load to that person or not judging from the various features taken into consideration.

 Learning Outcomes of the Study in respect of Data Science

I built multiple classification models and did not rely on one single model for getting better accuracy and using cross validation comparison I ensured that the model does not fall into overfitting and underfitting issues. I picked the best one and performed hyper parameter tuning on it to enhance the scores.

Limitations of this work and Scope for Future Work

Limitation is it will only work for this particular use case and will need to be modified if tried to be utilized on a different scenario but on a similar scale. Scope is that we can use it in companies to find whether we should provide loan to a person or not and we can also make prediction about a person buying an expensive service on the basis of their personal details that we have in this dataset like number of times data account got recharged in last 30 days and daily amount spent from main account, averaged over last 30 days (in Indonesian Rupiah) so even a marketing company can also use this.

# Thank you
